

## Network Tariff Audits.

### Reducing on-going energy cost by optimising network charges.

Complex network charges need to be regularly reviewed to avoid needless extra expense. At Smart Power, we conduct network tariff audits to identify the lowest cost option for each site.

#### Our comprehensive audit involves:

1. Analysing and identifying the optimal network tariff for each site.
2. Recommending ways to minimise current and future network charges.
3. Identify cost savings and at-risk sites.
4. Implementing recommended changes.

#### Benefits.

- Lower on-going costs.
- Improved quality of supply through early detection of power factor problems.
- Identify risks and implement solutions.

Significant and ongoing savings identified during network audits generally outweigh review costs within six months.

Our independent advice and our fixed network fee offers you peace of mind.

#### What our clients say.

“Our retailer reviewed our network charges, but Smart Power identified additional savings by optimising when we used power by correcting timing clocks and start-up processes. This led to the optimization of our network rates, and the savings paid for the work within six months.”

*“We had done energy procurement before, but never looked at a network tariff audit. We were amazed how large and how easy the savings were for doing nothing, just getting the right rates applied to our account. Smart Power handled the whole process and we saw savings immediately.”*
